Visualization Project

NC State Institute for Advanced Analytics – Career Services Dashboard

The Institute for Advanced Analytics (IAA) Career Services team collects information from students throughout the recruitment process, including interviews, job offers, employment acceptances, salary information, and recruiting sources. Students submit this information through Google Forms, and the responses are currently maintained in a spreadsheet that requires manual updates and ongoing data management.

While this information is valuable for tracking individual student progress and reporting employment outcomes, the current process makes it difficult to efficiently identify recruiting trends and evaluate student interview performance.

The goal of this project is to develop an interactive, automated dashboard that integrates directly with Google Forms responses, allowing Career Services to monitor student recruitment activity in near real time without manually updating spreadsheets. The dashboard should provide both individual student insights and class-wide recruiting trends.

Goals of the Project

- **Automate Data Collection and Reporting:** Develop a dashboard that automatically updates as students submit interview and employment information through Google Forms, eliminating the need for manual spreadsheet updates.
- **Track Student Recruitment Progress:** Create individual student profiles displaying interview activity, progression through recruiting stages (recruiter screen, first round, second round, final round), job offers, and acceptances.
- **Identify Students Needing Additional Support:** Develop a method for flagging students who participate in multiple recruiter screens or early-round interviews but don't advance. This will allow Career Services to proactively offer targeted interview preparation and coaching.
- **Identify Employer Recruitment Trends:** Track companies interviewing IAA students, including the number of students interviewed, interview frequency, and recruiting outcomes. Highlight employers demonstrating significant interest in IAA students as potential targets for employer outreach and partnerships.
- **Evaluate Recruiting Sources:** Analyze where students discover employment opportunities, including IAA Career Services, company websites, LinkedIn, alumni referrals, and other sources. Identify which channels generate the most interviews, offers, and accepted positions.
- **Analyze Salary and Compensation Trends:** Calculate average and median reported base salaries, signing bonuses, and total first-year compensation. Allow comparisons across employers, job roles, and other relevant categories.

- **Visualize Class-Wide Employment Outcomes:** Develop an overview of recruiting activity and employment outcomes, including total interviews, students receiving offers, accepted positions, and overall employment placement rates.

Additional Considerations

The dashboard should be intuitive, visually engaging, and easy to maintain for future cohorts. Ideally, Career Services should be able to filter data by student, employer, recruiting stage, and academic cohort.

Students are encouraged to recommend additional form enhancements, tools, predictive indicators, or dashboard features that could improve Career Services' ability to support students and strengthen employer relationships.
